

PAWNEE GENERATOR ADDITION IMPACT AND FEASIBILITY STUDY

**Xcel Energy Transmission Planning
May 2003**

Executive Summary

Xcel Energy Transmission Planning has studied the existing transmission system at the request of <omitted text> and has determined the transmission requirements and estimated costs to install either a 500 MW or 750 MW coal fired generator at Xcel Energy's Pawnee Generating Plant.

The estimated transmission cost for the 500 MW addition will be \$48.7 million and the estimated transmission cost for the 750 MW addition will be \$180.4 million. The time frame to get the transmission requirements constructed for the 500 MW and 750 MW generation additions will be a minimum of 24 months and 50 months, respectively.

Should <omitted text> decide to proceed with either of these options, detailed TOT 3 studies must be conducted with all owners of TOT 3 participating to determine the full impact of the generator addition on these transmission facilities. This study monitored these facilities, but did not determine if any additional reinforcements will be required. There is a possibility that additional transmission will be required to maintain existing TOT 3 capabilities.

Background

<omitted text> has requested Xcel Transmission Planning evaluate the impacts on the Colorado transmission system associated with the installation of a second coal fired generator at Pawnee to be sized with either a 500 MW or 750 MW generator.

Study Scope and Analysis

This second coal fired Pawnee unit, sized at 500 MW, will be about the same size as the existing Pawnee Unit; therefore, the new unit used the same parameters for the 500 MW case. For the 750 MW case, Four Corners #4 was used for the generator parameters. The parameters used are shown below in Table 1.

TABLE 1: GENERATOR PARAMETERS USED

BUS#	NAME	BSKV	ID	QMAX	QMIN	PMAX	PMIN	MBASE
14914	FCNGN4CC	22.0	4	395.0	-280.0	750.0	0.0	909.0
70310	PAWNEE	22.0	1	300.0	-130.0	530.0	300.0	613.7

The system model studied was a 2008 heavy summer load flow case used in the Southeast Colorado Power Plant Study as well as a 2008 heavy summer base case with a more updated system model for PSCo and the other area utilities. The study modeled a fairly high import level and all existing generation on at Pawnee, including Manchief. The study then ran sensitivities with other area generation dispatches to stress flows.

Study Methodology:

For planning studies, PSCo adheres to the WECC Reliability Criteria. For system intact conditions, PSCo planning criteria is to maintain system bus voltages between 0.95 and 1.05 per unit. Operationally, PSCo tries to maintain a system voltage profile ranging from 1.02 at generators to 1.0 or higher at load buses in the Denver/Boulder area. Following a single contingency, voltages must be within 0.90 and 1.10 per unit. Facility loadings must remain within 100% of their nominal steady state ratings for system intact conditions. Under certain contingency conditions, PSCo will allow a 110% short-term (emergency) rating for transmission lines and 115% for large transformers if the transformer follows a daily load curve.

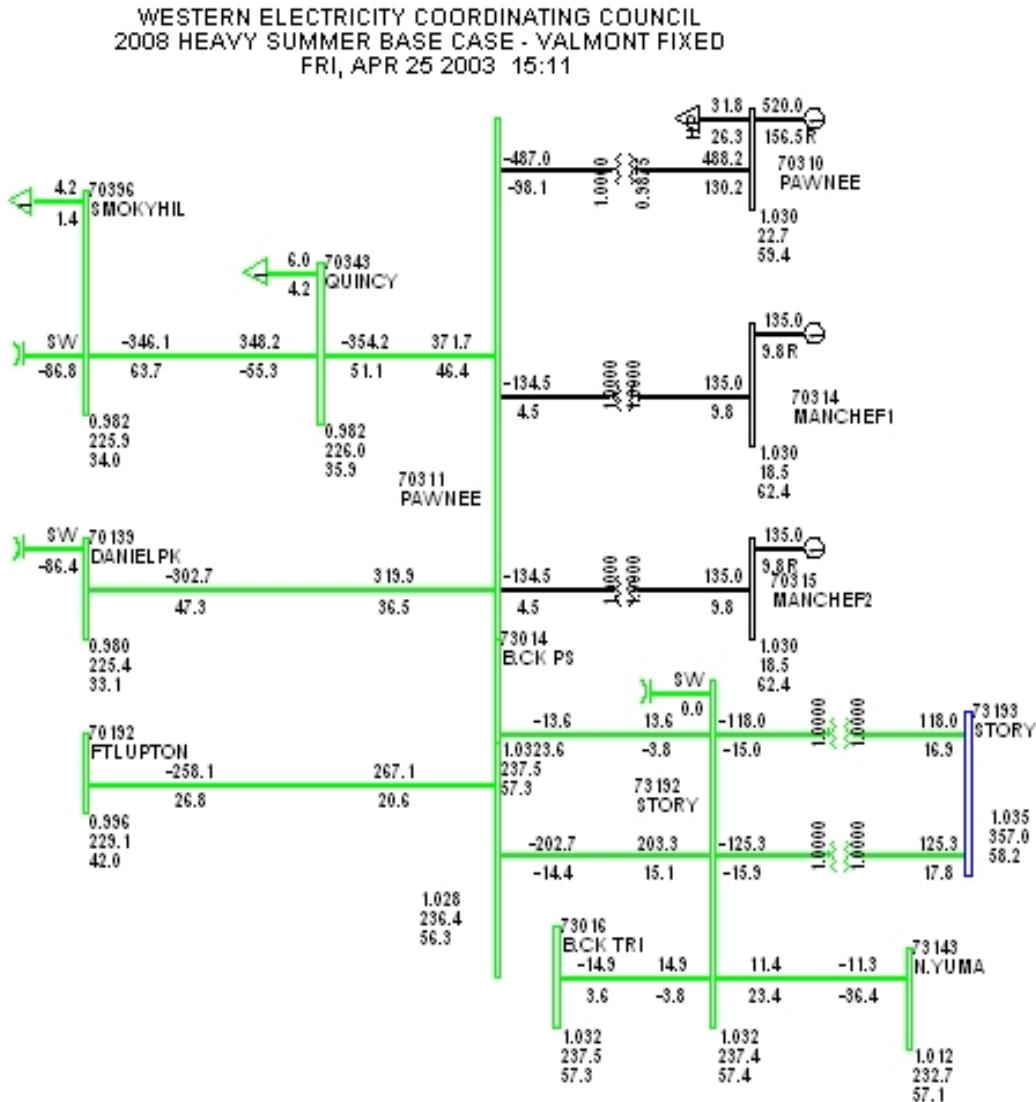

Contingency analysis examined the existing system's weaknesses and determined the minimal required system reinforcements. The process examined the 500 MW level of the new unit and then the 750 MW level. The 500 MW study level resulted in the addition of significant network reinforcements, Xcel Energy Transmission Planning attempted to determine the level of generation that could be added with minimal or no new facility additions. This level was approximately 65 MW and based on limitations as the results of a contingency on the 115 kV transmission lines around Ft. Morgan. To determine this limit, new generation was scheduled to the throughout Colorado. Table B-2 located in Appendix B, page 22 details this analysis.

As a starting reference point, all the analysis was performed with the base case before the additional Pawnee Generation was modeled. This provided a benchmark as to what reinforcements may be required before the added generation. Table B-1, page 18 in Appendix B shows these violations.

The study tools used were PTI's MUST software and PSS/E Version 28. The objective was to perform a quick analysis of the additional Pawnee generation levels and to determine the need for any system reinforcements.

Figure 1 shows a power flow one line of the existing Pawnee area transmission system.

FIGURE 1: PAWNEE AREA TRANSMISSION SYSTEM ONE-LINE

Xcel Energy Transmission Planning proposed to perform this study in two phases. Phase I focused on power flow analysis, excluding full TOT analysis. Phase II will cover

stability, if required, as well as a comprehensive TOT 3 study. These studies will be performed later if <omitted text> decides to pursue the development of the second generator at Pawnee. **Pawnee generation levels have direct impacts on TOT3 and it's limit, therefore a study with all TOT3 owners must be conducted.**

Results:

The existing transmission system is sufficient to deliver the existing Pawnee and Manchief generation in addition to the power flowing in from Story, high TOT 3 levels, system intact and under contingency conditions. Any excess capacity that existed on the transmission system when Pawnee Unit 1 was put in-service no longer exists due to the addition of Manchief and Brush generation and increased TOT 3 capability.

A. 500 MW Addition

An increase of generation at Pawnee will require new transmission as well as transmission upgrades for contingency conditions. For the system model studied, the new 500 MW Pawnee generator was modeled tied to the 230 kV bus similar to the existing unit 1. Under single contingency scenarios the Pawnee to Ft. Lupton 230 kV transmission line experiences significant overloads making this the limiting PSCo transmission facility. These results can be seen in Table B-3, page 26. **There are also reliability criteria violations under contingency conditions east of Pawnee on Western Area Power Administration's (WAPA) system that will need to be addressed through Phase II/TOT3 joint utility studies.**

To accommodate 500MW of additional generation at Pawnee, the Pawnee to Ft. Lupton 230 kV line should be rebuilt in the existing corridor and right-of-way to double circuit capability. This will increase the current capability from 416 MVA to 834 MVA/circuit. This will require modifications and upgrades at the Ft. Lupton and Pawnee substations. Small amounts of additional right-of-way may need to be acquired along the route since the existing right-of-way varies in width.

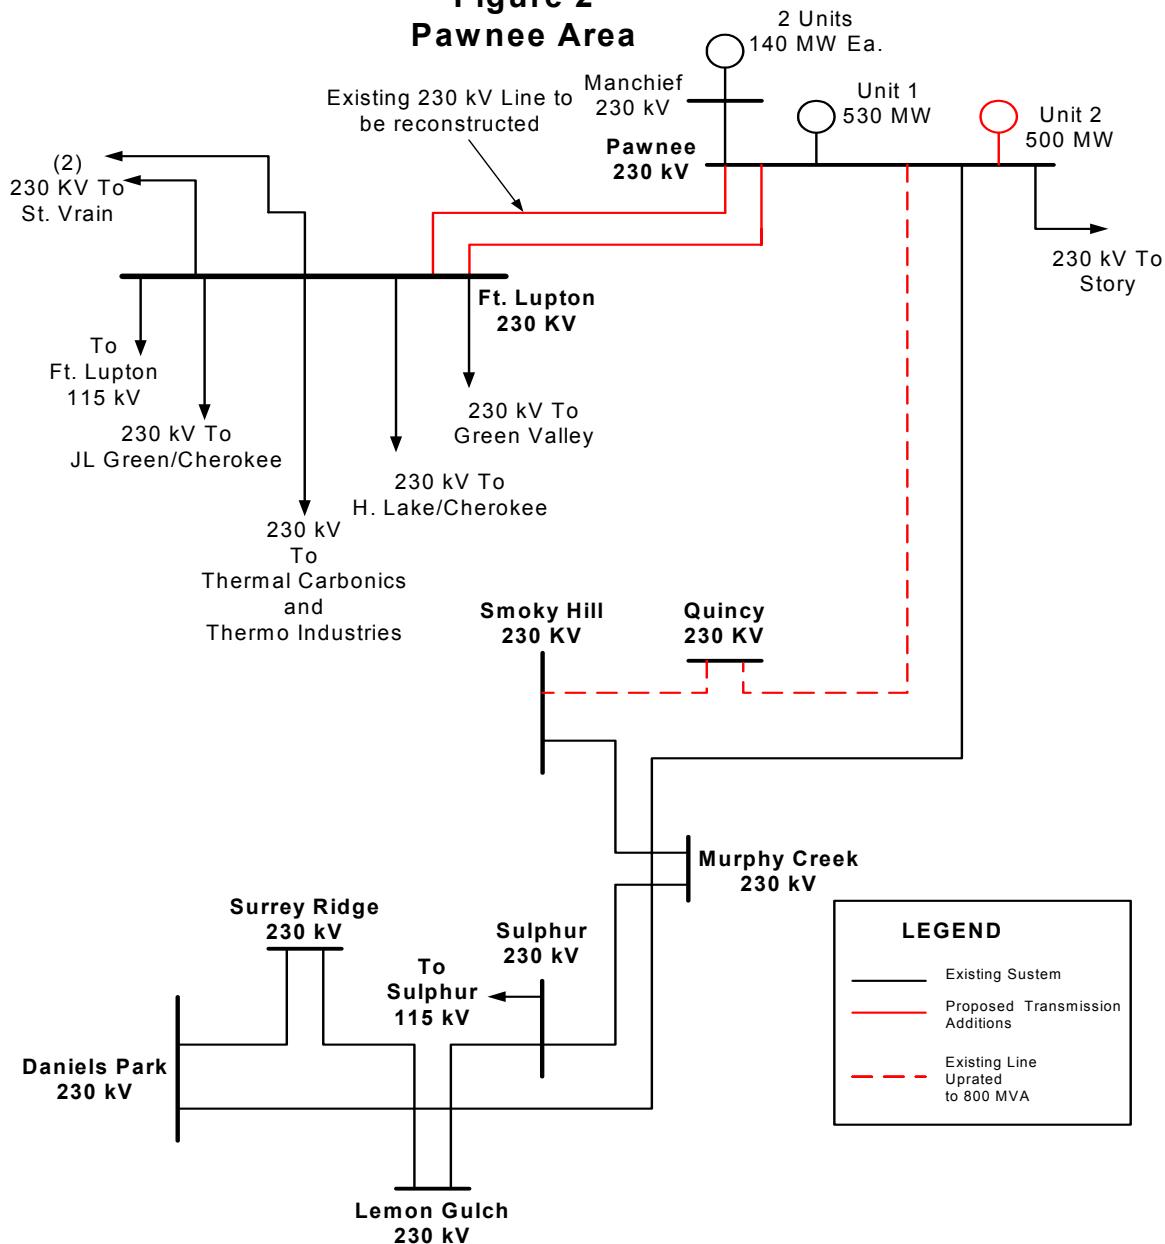

Because of the significant amount of existing generation in the Pawnee area, major outages to allow construction will likely be problematic. In order to accommodate transmission outages, the Pawnee to Smoky Hill 230 kV line should be uprated from 637 MVA to 800 MVA. This will require minimal construction, minimal cost, and very limited outages. This will also require some upgrades at Pawnee and Smoky Hill substations to handle the increase in ampacity.

Once this line is uprated, the Pawnee to Ft. Lupton 230 kV line can be removed for major reconstruction with little or no impacts to generation or import

capabilities. However, operating procedures will need to be developed for the loss of the Pawnee to Daniels Park or the Pawnee-Smoky Hill 230 kV lines during construction. These procedures will range from switching to generation re-dispatch.

Figure 2 shows a one-line of the proposed 500 MW system.

Figure 2
Pawnee Area

The total estimated cost for the previously described reinforcements is \$48.7 million in 2003 dollars. Please recognize that these are indicative estimates, similar to IRP estimates and are in the +/- 25% range. Please see Appendix A for a detailed description as well as major assumptions used in developing these costs.

As stated earlier, there are also reliability criteria violations under contingency conditions east of Pawnee on WAPA's system that will need to be addressed through Phase II/TOT3 joint utility studies. Table B-4 on page 29 details these criteria violations.

The estimated time frame for construction of these generator-required reinforcements is a minimum of 24 months.

To verify that this is the optimum solution, various generation dispatch scenarios for this 500 MW Pawnee addition were evaluated.

The other transmission alternatives considered included reconductoring the Pawnee to Smoky Hill and the Pawnee to Daniels Park 230 kV lines with larger conductors to increase capacity. Converting the Pawnee to Smoky Hill 230 kV circuit to 345 kV operation was also examined. The results of either of these options showed contingency violations with the most common being overloads on the Pawnee to Ft. Lupton 230 kV line. The Pawnee to Ft.Lupton 230kV line would need to be reconducted or rebuilt in addition to either of the above alternatives. And, as with the recommended alternative, uprates on the Pawnee to Smoky Hill 230kV line would also need to take place prior to major construction. Pursuing either of these alternatives would increase the costs significantly.

B. 750 MW Addition

Numerous system alternatives at 230 kV were evaluated in the development of the recommended plan required to accommodate the 750 MW of additional generation at Pawnee. Attempts at placing the generator on the existing 230 kV system produced multiple contingency criteria violations that could not be easily remedied with only 230 kV reinforcements thus resulting in a 345 kV solution.

The recommended system was determined to be the most efficient and least costly solution for the 750 MW generator addition.

For the 750 MW scenario the following transmission upgrades will be required:

1. Upgrade the existing 93 mile Pawnee to Smoky Hill 230 kV line from 637 to 800 MVA. (This was a requirement for the 500 MW case)
2. Remove the existing 64 mile single circuit 230 kV line from Pawnee to Ft. Lupton and construct a double circuit 230 kV transmission line in its place. (This was a requirement for the 500 MW case)
3. Construct a new Corner Point 345 kV and 230 kV switching station located approximately 40 miles east of Smoky Hill Substation and sectionalize the existing Pawnee to Daniels Park and Pawnee to Smoky Hill lines at this new switching station.
4. Reconduct and reinsulate the 54 miles of the existing 230 kV transmission lines from Pawnee that terminate at Smoky Hill and Daniels Park substations to 345 kV specifications from Pawnee substation to the new Corner Point Switching Station. From Corner Point switching station to just outside Smoky Hill substation, reconstruct 40 miles of the two existing 230 kV single circuit structures to a double circuit single structure monopole configuration. The 230 kV termination equipment at Smoky Hill and Daniels Park substations will remain the same and continue serving the same loads as today.
5. Construct from Corner Point switching station to Daniels Park substation 60 miles of double circuit 345 kV transmission on a single monopole structure.
6. Construct new 345 kV switchyards at Pawnee and Daniels Park.

7. Install 345/230 kV, 560MVA, autotransformers at locations shown in Table 2.

TABLE 2: LOCATION OF AUTOTRANSFORMERS FOR 750 MW GENERATOR ADDITION

LOCATION	NUMBER OF AUTOTRANSFORMERS
PAWNEE	2
CORNER POINT	2
DANIELS PARK	3

These reinforcements may require minimal amounts of additional permanent right-of-way in addition to some temporary easements that may be required during construction.

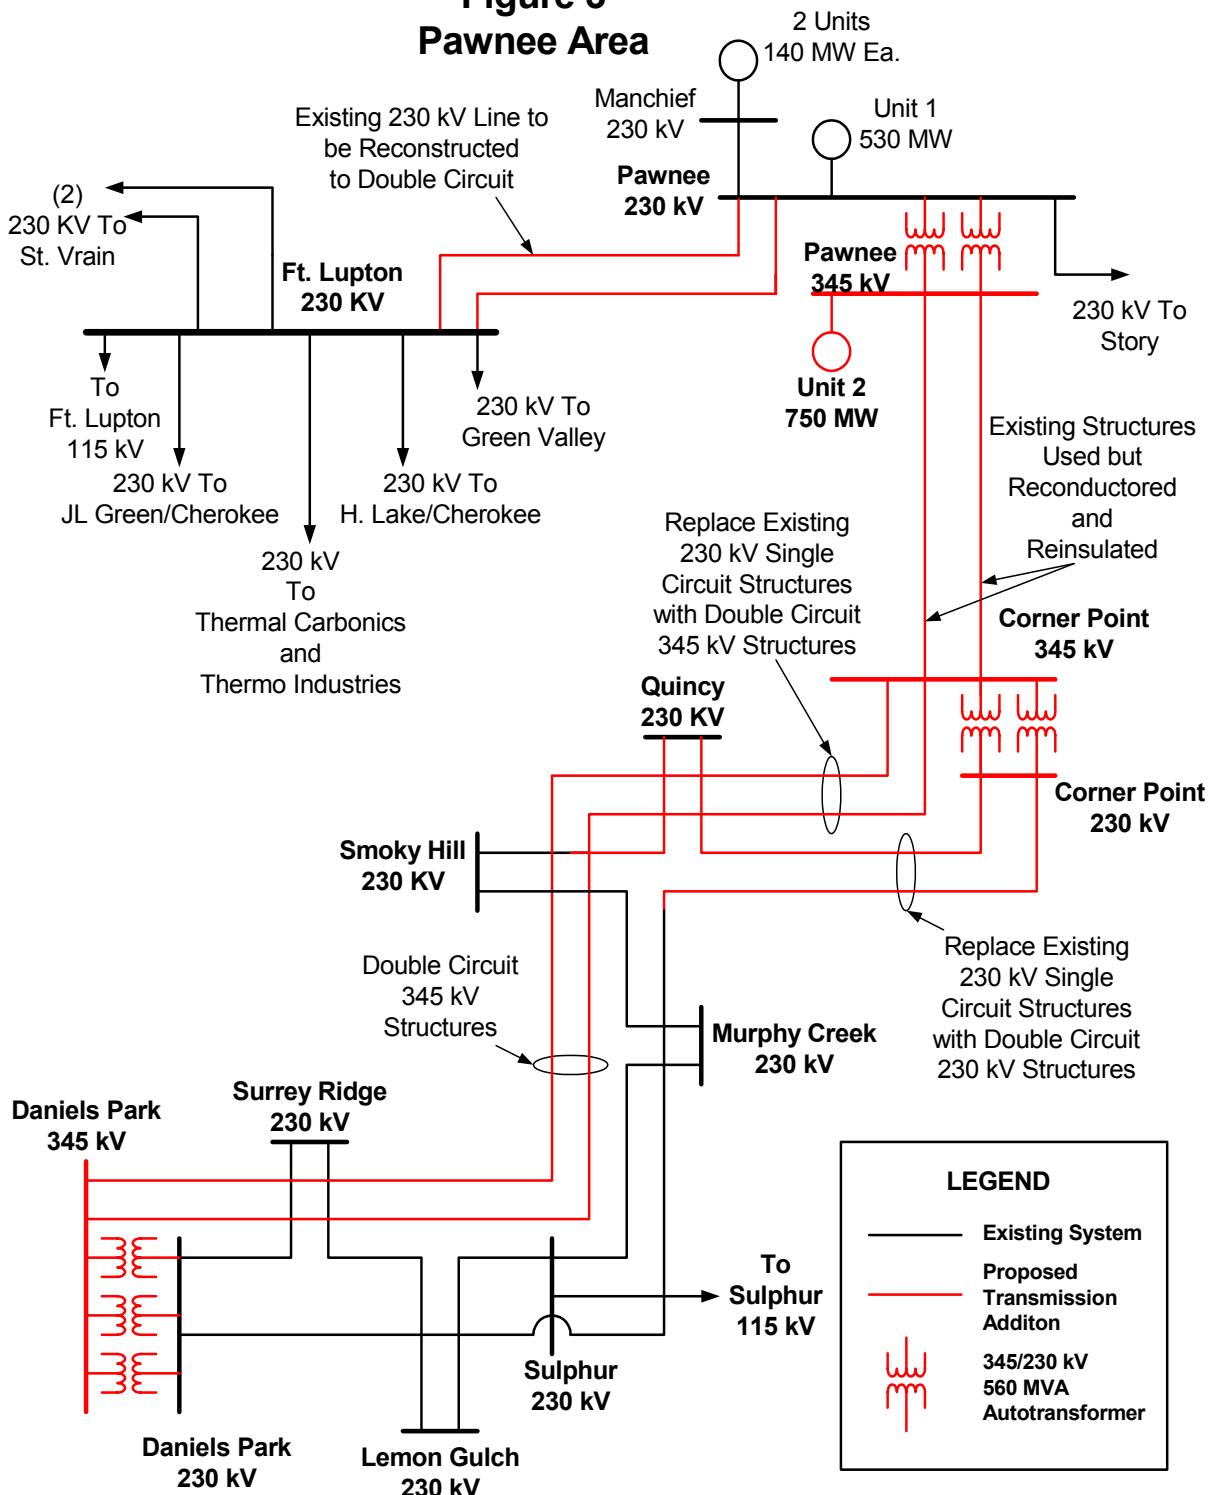

Figure 3 shows a one-line diagram of the proposed 750 MW system.

It is estimated that a minimum of 50 months be required for construction of these transmission facilities.

The total estimated costs for these additional reinforcements is \$180.4 million in 2003 dollars. Again these are indicative estimates, similar to IRP estimates and are in the +/- 25% range. Please see Appendix A for a detailed description as well as major assumptions used in developing these costs

There are also reliability criteria violations under contingency conditions east of Pawnee on Western Area Power Administrations system that will need to be addressed through Phase II/TOT3 joint utility studies. Table B-5 on page 31 shows criteria violations with the new generator connected to the 230 kV Pawnee bus and Table B-6 on page 34 shows the violations as a result of the added 345 kV reinforcements.

Figure 3
Pawnee Area

APPENDIX A

TRANSMISSION REINFORCEMENT COST DETAILS

**PAWNEE 500 MW GENERATION ADDITION
TRANSMISSION REINFORCEMENT COSTS**

ITEM	Siting & Land Rights Estimate	Trans Eng Estimate	Pawnee Sub Estimate	Smoky Hill Estimate	Ft. Lupton Estimate	Total
Upate Pawnee to Smoky Hill 230kV Single Circuit (S/C) trans line to 800MVA	\$100	\$500	\$520	\$625		\$1,745
Remove exist Pawnee to Ft Lupton 230kV SC trans line and const new Double Circuit (D/C) line in same ROW	\$1,000	\$38,500	\$1,800		\$1,230	\$42,530
10% Contingency						\$4,428
TOTAL						\$48,703

Overall timeline to complete all required transmission and substation work: more than 24 Months

Major Assumptions (Pawnee to Smoky Hill Upate):

1. Existing Pawnee-Smoky Hill will be uprated to 800 MVA based on 4-ft/sec wind calculations.
2. Existing conductor will be used, and only minor wood pole replacements are required.
3. Several new mid-span steel pole double circuit structures needed on the section from Smoky Hill east for approx. 3/4 mile.
4. At Smoky Hill, one existing bay will be upgraded to 3000 A.
5. At Smoky Hill, existing East and West main busses will be upgraded to 3000 A.
6. At Pawnee, one exist bay will be upgraded to 3000 A.
7. No additional land needed at Subs, minor trans line ROW acquisition, and only minor permitting efforts.

Major Assumptions (Pawnee to Ft. Lupton New Line):

1. Any NEPA requirements imposed on transmission as a result of the generation addition will most likely have adverse effects on schedule and deliverables
2. After the Pawnee-Smoky Hill line is uprated to 800 MVA, the existing S/C Pawnee-Ft. Lupton line can be taken out of service.
3. New 230 kV D/C line from Pawnee to Ft. Lupton will be constructed within existing 150' ROW after S/C line is removed.

4. New D/C line will be built with bundled 954 ACSR (54/7 Cardinal) per phase for a 2000 Amp capacity rating.
5. Only minimal ROW acquisition and permitting is needed.
6. At Pawnee, one new 2-breaker bay will be added for generation interconnection, with load control and revenue metering.
7. At Pawnee, one new 2-breaker bay will be added for one Ft. Lupton circuit term, existing term used for other circuit.
8. At Ft. Lupton, the Cherokee and Green Valley lines will be swung and re-terminated at different positions.
9. At Ft. Lupton, the exist 5525 bay will be upgraded to 3000 A, and the 5463 breaker will be replaced with new 2000 A breaker.
10. At Ft. Lupton, one new breaker added for new Cherokee termination.
11. At Ft. Lupton, no additional land is required, no new bays are being added, and all exist terminations will be used.

PAWNEE 750 MW GENERATION ADDITION TRANSMISSION REINFORCEMENT COSTS

500 MW Generation Addition Transmission Estimates (000)
 (This transmission is required for the 750MW addition as well)

ITEM	Siting & Land Rights Estimate	Trans Eng Estimate	Pawnee Sub Estimate	Smoky Hill Estimate	Ft. Lupton Estimate	Total
Upgrade Pawnee to Smoky Hill 230kV Single Circuit (S/C) trans line to 800MVA	\$100	\$500	\$520	\$625		\$1,745
Remove exist Pawnee to Ft Lupton 230kV SC trans line and const new D/C line in same ROW	\$1,000	\$38,500	\$1,800		\$1,230	\$42,530
10% Contingency						\$4,428
TOTAL						\$48,703

750 MW Generation Addition Transmission Estimates (000)

ITEM	Siting & Land Rights Estimate	Trans Eng Estimate	Pawnee Sub Estimate	Corner Point Estimate	Daniels Park Estimate	Total
Construct new 345/230 kV Corner Point Switching Station				\$12,100		\$12,100
Reconductor and insulate the two existing S/C 230 kV trans lines to 345 kV from Pawnee to Corner Pt -54 miles		\$13,220	\$11,500			\$24,720
Remove exist Pawnee/Corner Pt to Smoky Hill 230 kV S/C trans line and const new D/C 230 kV line in same ROW (one circuit to Smoky Hill and one to Daniels Park) - 41 miles		\$26,880				\$26,880
Remove exist Pawnee/Corner Pt to Daniels Park 230 kV S/C trans line to a point near Smoky Hill and const new D/C 345 kV line in same ROW - 40 miles		\$28,500				\$28,500
Construct new 345 kV D/C trans line in existing ROW from Smoky Hill area to Daniels Park - 24 miles		\$17,100			\$14,300	\$31,400
TOTAL	\$1,850	\$85,700	\$11,500	\$12,100	\$14,300	\$125,450
5% Contingency						\$6,273
TOTAL						\$131,723

Grand Total for the 750MW Generation Addition Transmission Estimates (000) = \$180,425

Overall timeline to complete all required transmission and substation work > 50 Months

Major Assumptions 500MW Generation Addition:

1. Existing Pawnee-Smoky Hill will be uprated to 800 MVA based on 4-ft/sec wind calculations.
2. Existing conductor will be used, and only minor wood pole replacement.
3. Several new mid-span steel pole D/C structures needed on the section from Smoky Hill east for approx. 3/4 mile.
4. At Smoky Hill, one exist bay will be upgraded to 3000 A.
5. At Smoky Hill, exist East and West main busses will be upgraded to 3000 A.
6. At Pawnee, one exist bay will be upgraded to 3000 A.
7. No additional land needed at Subs, minor trans line ROW acquisition, and only minor permitting efforts.
8. After the Pawnee- Smoky Hill line is uprated to 800 MVA, the existing S/C Pawnee-Ft. Lupton line can be taken out of service.
9. New 230kV D/C line from Pawnee to Ft. Lupton will be constructed within exist. 150' ROW after S/C line is removed.
10. New D/C line will be built with bundled 954 ACSR (54/7 Cardinal) per phase for a 2000 Amp capacity rating.
11. Only minimal ROW acquisition and permitting is needed.
12. At Pawnee, one new 2-breaker bay will be added for generation interconnection, with load control and revenue metering.
13. At Pawnee, one new 2-breaker bay will be added for one Ft. Lupton circuit term, existing term used for other circuit.
14. At Ft. Lupton, the Cherokee and Green Valley lines will be swung and re-terminated at different positions.
15. At Ft. Lupton, the exist 5525 bay will be upgraded to 3000A, and the 5463 breaker will be replaced with new 2000 A breaker.
16. At Ft. Lupton, one new breaker added for new Cherokee termination.
17. At Ft. Lupton, no additional land is required, no new bays are being added, and all exist terminations will be used.

Major Assumptions 750MW Generation Addition:

1. Any NEPA requirements imposed on transmission as a result of the generation addition will most likely have adverse effects on schedule and deliverables.
2. No screening has been estimated at any of the substations. If this is required the cost will be significant at each location.
3. These estimates do not include any cost for legal fees.
4. Detailed field investigations have not been conducted and could increase these estimates.
5. Only minimal transmission line ROW acquisition is assumed, since exist ROW will be utilized.
6. Permitting the new DC 345kV trans line from Smoky Hill to Daniels Park will be extremely difficult and could require legal action.

7. Two new 230kV bays will be added at Pawnee for the 345/230 interconnection to avoid major trans line crossings.
8. At Daniels Park both Greenwood circuits will be swung to a different termination to free up a termination for one 345/230 auto.
9. All necessary transmission line outages can be obtained. If not, const duration times will be longer.
10. All estimates are in 2003 dollars. There was no escalation used.
