

GI-2004-11**Transient Stability – No network upgrades. Lamar generator “CTY LAM 14.4” offline. Signal Hill Wind with Low Voltage Ride-through (LVRT)**

The fault scenarios were run to determine system response of the existing system without network upgrades. The second circuit of Boone-Lamar 230 kV, and the second circuit of Boone-Midway 230 kV were not present during these stability cases. In addition, the 25 MW unit at Lamar (CTY LAM 14.4 kV) was offline for this study.

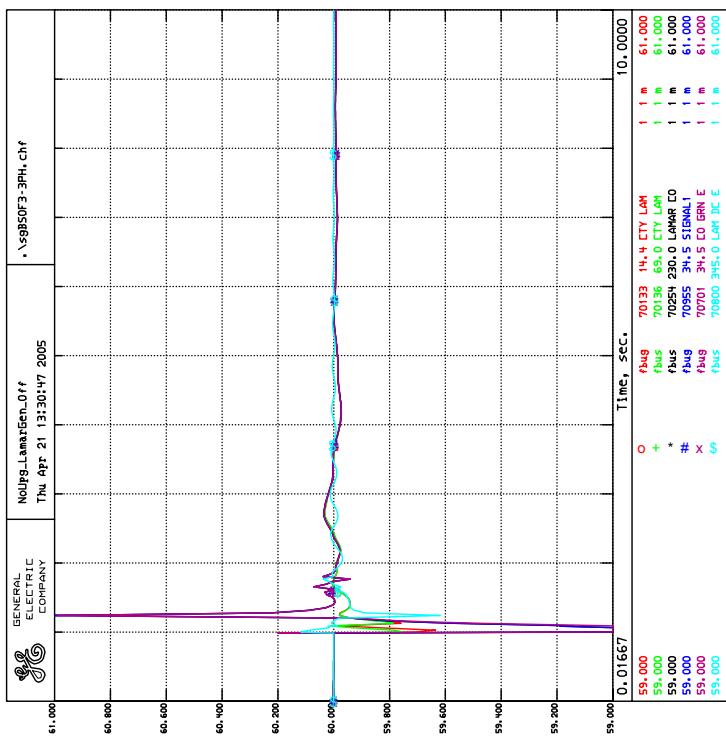

The Lamar DC tie was scheduled to import 210 MW (East to West). Table 1 shows the benchmark case results, while Table 2 illustrates the effect of adding the 69 MW Signal Hill Wind project without the associated network upgrades.

Note that the reliability criteria violations listed in Table 1 are not repeated in Table 2. Table 2 only shows the new or changed violations when compared to the benchmark case.

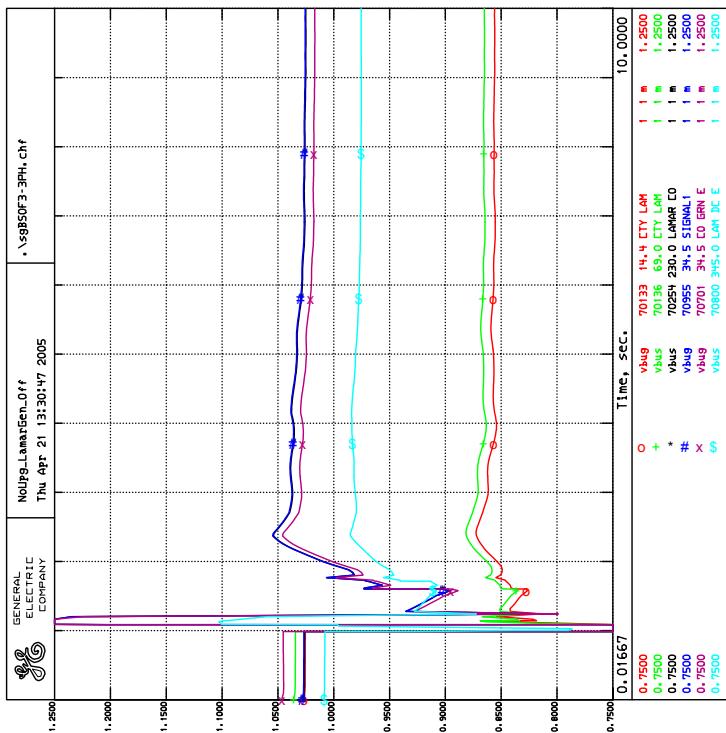

Table 1 - Transient Stability Results – Existing System with Lamar Generation Offline, Benchmark Case

	Fault Location	Action	Result
1	3PH at Lamar 230 kV bus, 4 cycles	Trip Boone-Lamar 230 kV line, circuit 2	Colorado Green Trips Model diverges at t=1.0667 (4 cycles)
2	3PH at Boone 230 kV bus, 6 cycles	Trip Boone-Lamar 230 kV line, circuit 2	Colorado Green Trips Model diverges at t=1.33 (20 cycles)
